

The version of NetHome/PC on our web site was revised in December 2008 to support our exciting NetWatchman Pro product.

May 2009

Genesis announced exciting enhancements to our suite of energy management features. This includes a new remote temperature sensor that plugs into any AC outlet and joins the Zigbee radio network. NetWatchman now also supports advanced RCS thermostats over a Zigbee radio network (via a new RS485 bridge product).

Additional enhancements include new features for our internet-weather-based sprinkler control software. We've also added features for making it easier for school children returning home and features for monitoring / granting-access to housekeepers.

November 2009

Genesis announced support for Insteon version 2. This includes the TriggerLinc Door Sensor and other Insteon wireless devices that can now be used as inputs to NetWatchman. In addition, NetWatchman now uses the 2412S Insteon Power Line Modem and that interface can be located remotely over a Zigbee Radio Network.

Note that NetHome is a Windows XP program. If you are using Windows 7, you must be running on a computer that supports XP Compatibility Mode.
